

ABC Pvt Ltd MIS Problem Statement

Business Problem

Management was receiving large volumes of data from different departments, but there was no consolidated reporting structure to provide a single view of business performance.

The key business requirements were to understand:

- How much sales the company generated
- Whether production targets were achieved
- Where production losses and rejections occurred
- Current inventory value and low-stock materials
- Whether expenses were within budget
- Workforce attendance and overtime
- Major operational exceptions requiring attention

The project therefore aimed to answer:

"How can raw departmental data be converted into accurate, consolidated and management-ready MIS reports for faster decision-making?"

Project Overview

ABC Pvt. Ltd. is a manufacturing company that receives operational data from multiple departments, including Sales, Production, Finance, Inventory and Manpower.

The objective of this project was to develop an integrated Excel-based MIS reporting system that converts raw departmental data into reliable management information.

The project covers the complete MIS reporting cycle:

Raw Data → Data Cleaning → Validation → Reconciliation → Analysis → KPI Reporting → Management Insights

The final solution consists of an Executive Summary Dashboard supported by individual departmental MIS reports.

Data Cleaning Steps

Data Cleaning

Sales Data

- Changed date column data type from date & time to short date
- Found 12000 sales record but there are three blank records in customer column So for now I have kept it and will be included to calculate Total sales (Using COUNTA() function)
- Two records in Quantity column was "<0" which is to be checked (Using MIN() function)
- Performed data standardization Change on record form "Wset — West" and "10 mm — 10mm" (Using table filter function)
- Found 3 duplicate Invoice No. transaction records (Using Conditional Formatting to Find Duplicates) – Retain records; flag invoice number as non-unique

Data Validation for Sales Data

- Typographical errors standardized
- Missing values identified
- Negative quantities identified
- Revenue reconciliation performed
- Invalid discounts identified
- Repeated invoice numbers investigated
- Exceptions documented
- Pending records flagged

Production Data

- Found 2 record where Actual Production Quantity is Negative (Used Min() function)
- There 624 records where actual production > target quantity (Used if() function)
- Found 1 record where Downtime is less then 0 (Used by table filters)

Data validation Steps

- Target Quantity ≤ 0
- Actual Quantity > Target Quantity — not necessarily an error, but worth analyzing
- Downtime < 0
- Rejection < 0
- Rejection > Actual Quantity
- Manpower ≤ 0
- Invalid Shift values
- Inconsistent Production Line names
- Inconsistent Product names
- Duplicate records

Finance Data

- Converted Date time to Short date Data type
- Converted Typo Error from Costt to Cost – 1 Record (Used Unique() function)
- Found 1 Blank Budget Records (Used Countblank() function)
- Found 1 Negative Actual Expense Record (Used If() function)
- Added 1 column to flag as verification Pending for 2 records Blank Budget and Negative Actual Expense
- Flagged Records for Sales Revenue because Mismatch in Sales in Finance & Sales Data

Data validation Steps

- Budget $\leq$ 0
- Actual $\leq$ 0 — investigate negative values rather than automatically treating them as errors
- Variance calculation
- Account naming inconsistencies
- Category inconsistencies
- Blank Account/Category
- Duplicate records

Inventory Data

- Converted Date time to Short date Data type
- Found Material Typo Steel Billets – Steel Billet
- Flagged two records where Closing Stock is negative
- Reconcile Closing stock by Source Closing stock - Calculated value (Opening stock + Purchase - Consumption)
- Found Unit Cost 0 for one record change to Rs.104 after from Master Material data
- Reconcile Inventory Value by Source Inventory value - Calculated value (Closing stock * Unit Cost)

Manpower Data

- Converted Date time to Short date Data type
- Found 2 Typo Error and Corrected Prst > Present and Production > Production
- Found 1 Record where Overtime is Negative, flagged for Verification
- Checked where Employee is Present and Leave is Yes but 0 record found
- Found 3 Records where Overtime is ">12" flagged and confirmed by HR
- Found 110 Records which may be a potential duplicated records flagged as Potential Duplicate record (Used Text join function to create a duplicate key (=TEXTJOIN(" ", TRUE, [@Date], [@Employee ID], [@Shift]))
- Found an Employee working in two department flagged as Department check

Data Source & Cleaning

Data Sources

The project uses five departmental datasets.

Department	Purpose
Sales	Revenue, quantity, customers, products and salesperson performance
Production	Production output, targets, downtime and rejection
Finance	Budget, actual expenses and variance
Inventory	Stock, purchases, consumption and inventory value
Manpower	Employees, attendance, leave and overtime

The datasets were intentionally treated as **raw operational data**, requiring validation before being used for management reporting.

MIS Data Quality & Validation Process

Before creating dashboards, the datasets were reviewed for data-quality issues.

The approach followed was:

Identify → Validate → Investigate → Correct/Flag → Document → Exclude from MIS where necessary

A separate **Data Quality Log** was maintained to document exceptions, actions and verification status.

Sales Data Validation

The Sales dataset contained approximately **12,000 records**.

Checks performed

- Converted Date/Time into a standardized Short Date format.
- Identified 3 records with blank Customer values.

- Identified 2 records with negative quantities.
- Standardized inconsistent values such as:
 - Wset → West
 - 10 mm → 10mm
- Identified 3 repeated Invoice Numbers.
- Reconciled source revenue against calculated revenue.
- Identified revenue mismatches.
- Identified invalid discount records.
- Added a **MIS Status / Verification Pending** field for unresolved exceptions.

Treatment

Confirmed data-standardization issues were corrected.

Records requiring business confirmation were retained in the source data but **flagged and excluded from relevant MIS calculations until verification**.

This approach preserves the original data while preventing questionable records from affecting management reporting.

Production Data Validation

Production data was reviewed for operational and logical inconsistencies.

Checks performed

- Identified 2 records with negative Actual Production Quantity.
- Identified records where Actual Production exceeded Target.
- Identified a record with negative Downtime.
- Checked for negative Rejection values.
- Checked whether Rejection exceeded Actual Production.
- Checked Target Quantity and Manpower values.
- Reviewed Shift, Production Line and Product consistency.
- Checked for potential duplicate records.

Important business rule

Actual Production exceeding Target is **not automatically treated as an error**.

It may indicate that production exceeded the planned target and therefore requires analysis rather than deletion.

Finance Data Validation

Finance data was validated before calculating financial KPIs.

Checks performed

- Standardized Date/Time.
- Corrected **Costt** → **Cost**.
- Identified a blank Budget record.
- Identified a negative Actual Expense record for verification.
- Reconciled Budget, Actual and Variance.
- Checked Account and Category consistency.
- Identified Sales/Finance revenue reconciliation differences.
- Flagged records requiring Finance/Sales verification.

Key principle

Negative financial values were **not automatically deleted**, because negative transactions may represent legitimate business activities such as reversals, refunds or adjustments.

They were therefore investigated and flagged where appropriate.

Inventory Data Validation

Inventory records were reviewed for stock and valuation accuracy.

Checks performed

- Standardized Date/Time.
- Corrected material naming inconsistency:
 - **Steel Billets** → **Steel Billet**
- Identified 2 records with negative Closing Stock.
- Reconciled Closing Stock using:

Calculated Closing Stock = Opening Stock + Purchase – Consumption

- Identified a Unit Cost of zero.
- Verified the Unit Cost against Master Data and corrected it.
- Reconciled Inventory Value using:

Inventory Value = Closing Stock × Unit Cost

Records requiring warehouse verification were flagged from MIS calculations.

Manpower Data Validation

The Manpower dataset was validated for attendance, employee and overtime reporting.

Checks performed

- Standardized Date/Time.
- Corrected:
 - Prst → Present
 - Production → Production
- Identified a negative Overtime record.
- Checked for employees marked both Present and Leave.
- Identified 3 records with Overtime greater than 12 hours and verified them with HR.
- Created a duplicate key using Date + Employee ID + Shift.
- Identified potential duplicate attendance records.
- Identified an employee associated with two departments and flagged it for HR verification.

Potential duplicate and verification-pending records were excluded from relevant MIS calculations.

Data Quality Governance

A Data Quality Log was maintained throughout the project.

Each exception included:

Field	Purpose
Record/Reference	Identify affected record
Error	Describe the issue
Column	Identify affected field

Action	Required business action
Status	Pending / Closed
What Done	Document treatment

This creates an audit trail and demonstrates that the MIS report is not simply built from raw data.

Analysis

Executive Overview

- Total Sales - Use Pivot tables and applied filter ;Remove the records where there was Verification pending got the value 570740228.52
- Total Production - Use Pivot tables and applied filter ; Remove the records where there was Verification pending got the value 2991014 and Use Formula actual/target to find Production Achieved % and got 90%
- Sales Growth % - Use Pivot tables and applied filter; Remove the records where there was Verification pending got the value 15.2% for Last Month i.e Dec we Grew 15% from Nov Sales
- Rejection % - Use Pivot tables and applied filter; Remove the records where there was Verification pending got the value 2.5% formula for Rejection %, I used (rejection/actual quantity)
- Inventory Value - Use Unique() to list out all materials and use `=MAXIFS(Inventory[Date],Inventory[Material],Material)` to find latest date and to find inventory value for latest date, used xlookup()
`=XLOOKUP(Material&Date,Inventory[Material]&Inventory[Date],Inventory[Calculated Inventory Value],0,0)` to find value for individual material then sum up all the records and got 4761597 value
- Low-stock Materials Use Unique() to list out all materials and use `=MAXIFS(Inventory[Date],Inventory[Material],Material)` to find latest date and to find closing stock for latest date, used xlookup()
`=XLOOKUP(Material&Date,Inventory[Material]&Inventory[Date],Inventory[Closing stock],0,0)`, similarly pulled out reorder level to find value for individual material then sum up all the records and got 2 Low stock Material
- Budget vs Actual - Use pivot and put actual and Budget Column in values; Remove the records where there was Verification pending, actual value is 1175014057.32 and budget is 1154078115 and Calculated Variance i.e (Actual - Budget) is 20935942.32 and Budget Utilization i.e (Actual/Budget) is 102%
- Total Employees - Count Employees Using `=COUNTA(UNIQUE(Manpower[Employee ID]))` formula and get 250 Employees Working
- Attendance % - Use Pivot tables to find out attendance % Used Present Employees / Total Records and got 60% ; Removed the Verification Pending and Potential Duplicate Records

Sales Analysis

- Monthly Sales Trend - Use Pivot and use Month column and Calculated Revenue Column to show sales trend; Remove the records where status was Verification pending, Got Nov as Lowest Revenue Month with 43.2 M sales and Peak sales month as Month of Jul with 52.4 M sales - Visual used line chart
- Sales by Region - Use Pivot and use Region column and Calculated Revenue Column to show Region Comparison; Remove the records where status was Verification pending, Noticed that all the region does the sales about 140 M where

East contribute 141.4 M sales at last while South has overall highest sales 143.7 M, closely followed by north with 143.6 M sales – Visual used column chart

- Sales by Product - Use Pivot and use Product column and Calculated Revenue Column to show Production Comparison; Remove the records where status was Verification pending, Noticed MS Pipe 2in contribute 95.6 M with the top product performer on the basis of revenue and Steel plate 8mm contribute only 47.8 M which is at Last – Visual used Bar chart
- Salesperson Performance - Use Pivot and use Salesperson column and Calculated Revenue Column to show Production Comparison; Remove the records where status was Verification pending, Pooja desai Perform Exceptionally well crossing 100 M i.e she comes with 101.3 M sales and at last we have Rahul Shah with 90.8 M sales – Visual used Bar chart
- Top Customers - Showed Customers Analysis using Pivot tables and Conditional Formatting

KPI for Sales Report

- ; Remove the records where status was Verification pending
- Quantity Sold - Use Pivot table and used Quantity column and got 5216926
- Average Order Value - Used Counta(), Unique() and Filter() to Extract Unique Orders excluding Verification Pending records and divided by Total Revenue and got 47585.48
- Discount % - Use Pivot table, use Average Discount , got 3.8% Average Discount
- Total sales - Use Pivot table and used Calculated Revenue column and got 570740228.52

Finance MIS

Top KPI

- Budget - Use pivot Table and used Budget column in value and ; Remove the records where status was Verification pending and got 1154078115
- Actual - Use pivot Table and used Actual column in value and ; Remove the records where status was Verification pending and got 1175014057.32
- Variance - Use pivot Table and used Calculated Variance column in value and ; Remove the records where status was Verification pending and got 20935942.32
- Budget Utilization - use Formula (Actual / Budget) to find Budget Utilization and got 102%
- Monthly Expense Trend - Use Pivot table to Summarise Actual Expense Month-wise and showed the trend using line chart and found April with Highest spending month with 118 M Expense and Jan with only 80.7 M Expense
- Expense by Category - Use Pivot table for analysis ; Remove the records where status was Verification pending and got Cost value as 760.5 M and Operating Expense as 312 M – Use Donut chart to Visualise
- Highest Cost Accounts – Use Pivot table and use Account column ; Remove the records where status was Verification pending and Got Raw Material Purchase account with 122.4 M with highest Cost and Rent & Utilities comes at last with 94.3 M cost

3. Production MIS

Top KPI

- Production – Use Pivot table and calculated Production using Actual Quantity Column ; Remove the records where status was Verification pending and Got 2991014 value
- Achievement % Use Formula (Total Actual / Total Achieved) and calculated using Actual Quantity Column and Actual Target Column ; Remove the records where status was Verification pending and Got 90% achieved
- Downtime – Use Pivot table and calculated Downtime using DowntimeColumn ; Remove the records where status was Verification pending and Got 12891.8
- Rejection % - Use Formula (Total Rejection / Total Actual) and calculated Rejection % ; Remove the records where status was Verification pending and Got 2.5%
- Production Trend - Use Pivot table to find Month wise Production trend analysis; Remove the records where status was Verification pending and found Dec with highest production month with 278403 units and Jun with 218871 Units which is at last – Visualize using line Chart
- Production by Line - Use Pivot table for Production Line analysis; Remove the records where status was Verification pending and Got Line 5 with highest production i.e 612486 units and Line 4 with 586784 units which remains at Last – Visualize using Column chart
- Production by Shift - Use Pivot table for Shift analysis; Remove the records where status was Verification pending and Found shift B with highest production with 1023874 units and shift with 727 units at last – Visualize using column chart
- Downtime Trend - Use Pivot table for Downtime trend analysis; Remove the records where status was Verification pending and Jan with the highest Downtime with 1225.1 Hours and Apr with only 940.6 Hours – Visualize using Line chart
- Rejection by Product – Use Pivot table for Rejection analysis; Remove the records where status was Verification pending and Industrial Wire has 10125 units rejected which is highest from other products and steel Rod 12 mm has 8760 units rejected which is the lowest – Visualize using bar chart

4. Inventory MIS

Top KPI

- Total Inventory Value - Use Formula to find the inventory value at the end of the december and got 4.8 M value
- Total Material as Closing Stock we have 26,302 units of material at the end of the december
- Low stock Material - Use Formula and Find that are 2 material which are below reorder level
- Total material Consumed - Use Pivot table to calculated total material Consumption for the month dec 25 and got 26302 units

- Material wise Dec month Report - Create a table using List out Unique material Required which are req in Inventory using Unique(), took out last date when the records was listed in the data, i.e, 31st using Maxifs(), and took Closing stock, Inventory Value using Nested Xlookup() function, State Low stock order using combination of xlookup() and if() function
- Purchase – Use Pivot table to analyze the purchase of material over the period of one year ;Remove the records where status was Verification pending and Our highest purchased is for Packaging sheet i.e 390,389 units and Lowest material purchased is Welding Electrode with 306,157 units – Visualized through bar chart
- Consumption – Use Pivot table to analyze the Consumption of material over the period of one year ;Remove the records where status was Verification pending and Our highest Consumption is for Copper Wire Rod i.e 383,205 units and Lowest material Consumption is Welding Electrode with 330,679 units – Visualized through bar chart

Manpower MIS

Top KPI

- Total Employees - Found using formula Unique() and got 250 unique employees record
- Attendance % - using pivot table found No. of Present Employees and found 60 % attendance rate used formula (present / total records) ;Remove the records where status was Verification pending and Potential duplicate records
- Leave % - using pivot table found No. of leave Employees and found 20 % Leave rate used formula (leave / total records) ;Remove the records where status was Verification pending and Potential duplicate records
- Overtime Hours - Use pivot table to calculate total Overtime and got 7314 ;Remove the records where status was Verification pending and Potential duplicate records
- Department wise Employee - Use formula to find employees per department
`(=COUNTA(UNIQUE(FILTER(Manpower[Employee ID], (Manpower[Department]=A418) * (Manpower[MIS Status]<>"Verification Pending") * (Manpower[MIS Status]<>"Potential Duplicate") * (Manpower[MIS Status]<>"Department check")))))` ;Remove the records where status was Verification pending and Potential duplicate records and Also employee who worked in two department and Production has 118 employee and Finance has lowest i.e 12 employee
- Department-wise Manpower - Use Pivot table for analysis ;Remove the records where status was Verification pending and Potential duplicate records and found Production with 1680 Manpower deployment and Admin with only 174 Manpower Deployment

- Shift-wise Attendance - Use Pivot table for analysis ;Remove the records where status was Verification pending and Potential duplicate records and found Shift A with 1202 Manpower deployment and Shift B with 1165 Manpower Deployment
- Overtime by Department – Use Pivot table for analysis ;Remove the records where status was Verification pending and Potential duplicate records and found Production with highest 3465 Hrs Overtime and Finance with 356 Hrs Overtime
- Overtime by Shift – Use Pivot table for analysis ;Remove the records where status was Verification pending and Potential duplicate records and found Shift A with highest 2512 Hrs Overtime and Shift B with 2346 Hrs Overtime

Reports Section

Executive Summary

Metric	Visualization	Why this metric? / Business value
Total Sales	 KPI Card	Shows the company's overall sales performance for the reporting period and gives management an immediate view of revenue generated.
MoM Sales Growth	 KPI Card	Shows whether sales are improving or declining compared with the previous month, helping management identify positive or negative trends quickly.
Total Production	 KPI Card	Shows total output generated during the period and gives management a quick view of production volume.
Production Achievement %	 KPI Card	Compares actual production with the target and shows whether the company is meeting its production plan.
Rejection %	 KPI Card	Measures the percentage of production rejected and helps management monitor product quality and production losses.
Inventory Value	 KPI Card	Shows the value of stock currently held by the company and helps management monitor capital tied up in inventory.

**Low
Stock
Materials**

 KPI
Card

Identifies materials below reorder levels and helps prevent production disruption caused by material shortages.

**Budget
vs Actual**

 KPI/Column
Chart

Shows whether actual expenditure is within the approved budget and highlights financial overspending.

**Budget
Utilization %**

 KPI
Card

Shows how much of the available budget has been consumed and helps management control expenditure.

**Total
Employees**

 KPI
Card

Shows the size of the workforce and provides management with a quick view of available manpower.

Attendance %

 KPI
Card

Measures workforce availability and helps identify attendance-related operational concerns.

**Overtime
Hours**

 KPI
Card

Shows additional working hours and helps management monitor workload, staffing requirements and overtime costs.

**Management
Insights**

 Text

Converts numbers into business observations so management can quickly understand important trends and exceptions.

Sales Report

KPI Cards

Metric	Why? / Business Value
Total Sales	Shows how much revenue was generated during the year and provides the primary measure of sales performance.
Total Quantity Sold	Shows the volume of products sold and helps management understand sales volume in addition to revenue.
Average Order Value (AOV)	Shows the average revenue generated per order and helps management understand customer purchasing value.
Average Discount	Shows the average discount given to customers and helps management monitor pricing and margin impact.

Charts

Chart	Why? / Business Value
Monthly Sales Trend	Shows how sales performed month by month and helps identify peak, low and seasonal periods.
Sales Performance by Region	Compares regional sales and helps management identify strong and weak geographical markets.
Sales Performance by Product	Shows which products generate the most revenue and helps support product-level sales and inventory decisions.

Salesperson Sales Performance	Compares individual salesperson performance and helps management identify high performers and areas requiring support.
Top Customers by Sales	Identifies customers contributing the most revenue and helps management prioritize key customer relationships.

Example

Sales Trend: "Sales increased in July and declined in November."

The management question becomes:

Why did July perform better? Why did November decline?

That's where MIS becomes useful—not just displaying the chart.

Finance Report

Metric / Chart	Why? / Business Value
Budget vs Actual	Shows whether spending is within the approved budget and highlights overspending.
Budget Utilization	Shows how much of the budget has already been consumed and helps management control financial resources.
Monthly Expense Trend	Shows spending month by month and helps identify unusually high or low expenditure periods.

Expense Category Mix	Shows how expenses are distributed across categories and identifies where most money is being spent.
-----------------------------	--

Expense by Account	Identifies the accounts contributing the highest costs and helps management investigate major expense drivers.
---------------------------	--

Monthly Variance	Shows where Actual differs from Budget each month and helps identify periods requiring financial investigation.
-------------------------	---

Business question it answers:

"Where are we spending more than planned, and when did the overspending occur?"

That's why **Budget vs Actual + Monthly Variance** are particularly valuable in an MIS report.

Production Report

Metric / Chart

Why? / Business Value

Total Production	Shows total manufacturing output during the period.
-------------------------	---

Production Achievement %	Shows whether actual output met the planned production target.
---------------------------------	--

Monthly Production Trend	Shows production performance month by month and identifies production peaks and declines.
---------------------------------	---

Production Performance by Line	Compares production lines and identifies high- and low-performing lines.
Production Performance by Shift	Compares output across shifts and helps identify differences in shift productivity.
Monthly Downtime Trend	Shows when production downtime was highest and helps management investigate equipment or operational issues.
Rejection Units by Product	Identifies products generating the highest rejection and helps focus quality-improvement efforts.

Business question it answers:

"Are we producing enough, efficiently, and with acceptable quality?"

Inventory Report

Metric / Chart	Why? / Business Value
Total Inventory Value	Shows the amount of company capital currently tied up in inventory.
Closing Stock Units	Shows the quantity of materials available at the reporting date.
Low Stock Materials	Identifies materials below reorder level and helps prevent stockouts and production interruptions.

December Material Consumption	Shows the latest month's material usage and helps management understand current consumption levels.
Material-wise Inventory Position	Provides a detailed view of each material's closing stock, value and stock status.
Annual Material Purchase Volume	Shows which materials were purchased most during the year and helps monitor procurement requirements.
Annual Material Consumption Volume	Shows which materials were consumed most and helps understand material demand and usage patterns.

Business question it answers:

"Do we have enough material to support operations without holding excessive stock?"

This is why **Inventory Value + Low Stock Materials** are particularly important on the Executive Summary.

Manpower / HR Report

Metric / Chart	Why? / Business Value
Total Employees	Shows the size of the workforce available to the organization.
Attendance %	Measures workforce availability and helps identify attendance-related operational issues.

Leave %	Shows the proportion of employee records associated with leave and helps management understand workforce availability.
Total Overtime	Measures additional working hours and helps monitor workload and potential overtime costs.
Employees by Department	Shows workforce distribution across departments and helps management understand staffing levels.
Attendance Records by Department	Shows attendance activity across departments and can highlight departments requiring further investigation.
Overtime Hours by Department	Identifies departments with the highest overtime and helps management investigate workload or staffing requirements.
Attendance Records by Shift	Compares workforce attendance activity across shifts.
Overtime Hours by Shift	Identifies shifts generating the most overtime and helps management evaluate staffing and workload.

Business question it answers:

"Do we have the right workforce availability, and where are we using additional working hours?"

Insights

Management Insights

December sales increased 15.2% MoM, while finance expenses exceeded budget by ₹20.9M, while 2 materials are below reorder level..

Sales Report

Key Insights to mention

- **July** was the peak sales month — ₹52.4M.
- **November** was the lowest — ₹43.2M.
- **South** was the highest-performing region — ₹143.7M.
- **MS Pipe 2in** was the top product — ₹95.6M.
- **Pooja Desai** was the top salesperson — ₹101.3M.
- **December sales increased 15.2% MoM.**

Finance Report

Key Finance Insights

- **April** had the highest monthly expense — ₹118M.
- **January** had the lowest expense — ₹80.7M.
- **Raw Material Purchase** was the highest-cost account — ₹122.4M.
- **Cost** was the largest expense category — ₹760.5M.
- **December** recorded the highest unfavorable variance — ₹5.2M.
- Overall expenses exceeded budget by ₹20.9M.

Production Report

Key Production Insights

- **December** had the highest production — **278,403 units**.
- **June** had the lowest production — **218,871 units**.
- **Line 5** recorded the highest production — **612,486 units**.
- **Shift B** recorded the highest production — **1,023,874 units**.
- **January** had the highest downtime — **1,225.1 hours**.
- **Industrial Wire** had the highest rejection — **10,125 units**.
- Overall production achieved **90% of the target**, with a **2.5% rejection rate**.

Inventory Report

Key Inventory Insights

- **Inventory value** stood at **₹4.8M** at the end of December.
- **26,302 units** were available as closing stock at month-end.
- **2 materials** were below their reorder levels — **GI Sheet and Lubricant**.
- **December material consumption** was **244,046 units**.
- **Packaging Sheet** had the highest annual purchase volume — **390,389 units**.
- **Copper Wire Rod** had the highest annual consumption — **383,205 units**.
- **Welding Electrode** had the lowest annual purchase volume — **306,157 units**.

Manpower Report

Key Manpower Insights

- **Production** had the highest employee count — **118 employees**.
- **Finance** had the lowest employee count — **12 employees**.
- **Production** recorded the highest overtime — **3,465 hours**.
- **Shift A** had the highest attendance records — **1,202**.
- **Shift A** also recorded the highest overtime — **2,512 hours**.
- Overall workforce attendance stood at **60%**, with **7,314 overtime hours** recorded.
